¹⁾ Any irregular stress is only permissible up to the specified limits provided none of the other stresses occurring at the time can also reach that value. If this condition is not met, the limit values must be reduced. If 30 % of the bending limit moment and lateral limit force occur at the same time, only 40 % of the axial limit force is permissible and nominal torque must not be exceeded. The permissible bending moments, axial forces and lateral forces can affect the measurement result by approx. 1 % of nominal torque.
